

## BMF 57 - PAH METABOLITES

The major source of PAHs is incomplete combustion of organic material like coal, oil or wood. Except of breathing in contaminated air from e.g. cigarette smoke or a fire place, eating food is a significant source of PAHs for humans, too. Exposure to PAHs means always a mixture of PAHs - therefore the dynamics of metabolism are important and dependent on composition of the mixture.

Chiron AS offers a broad selection of PAH Nitro-/Amino- and Hydroxy-/Keto- Metabolites as reference materials. Please inquire for more details (solution, neat).
